---

# Acknowledgments

---

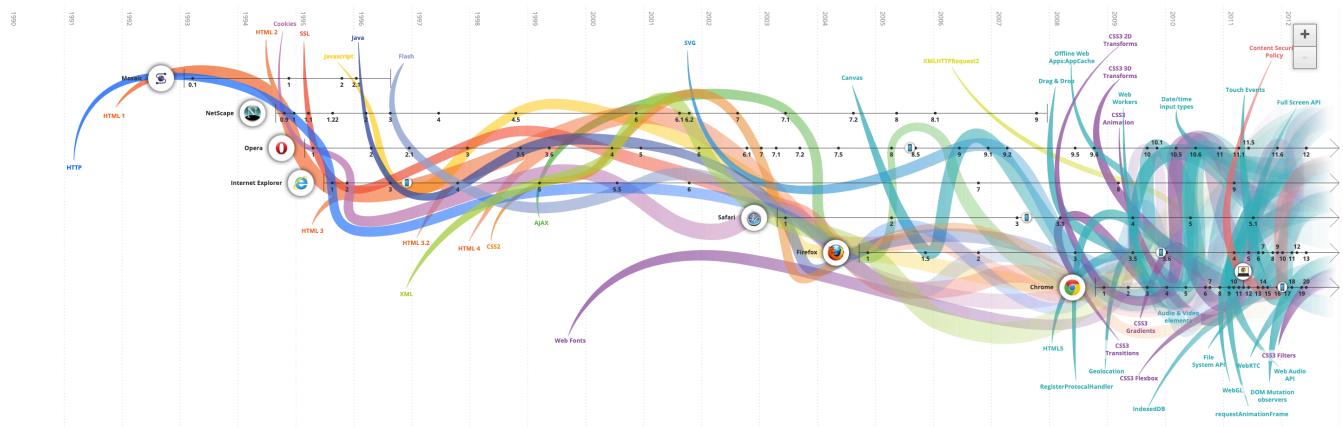

- This set of slides are derived from those authored by Prof. Fulvio Corno for the course “Sistemi Informativi Aziendali” at Politecnico di Torino
- Many thanks to Fulvio for kindly sharing his materials

---

3

# Evolution of web architectures

---

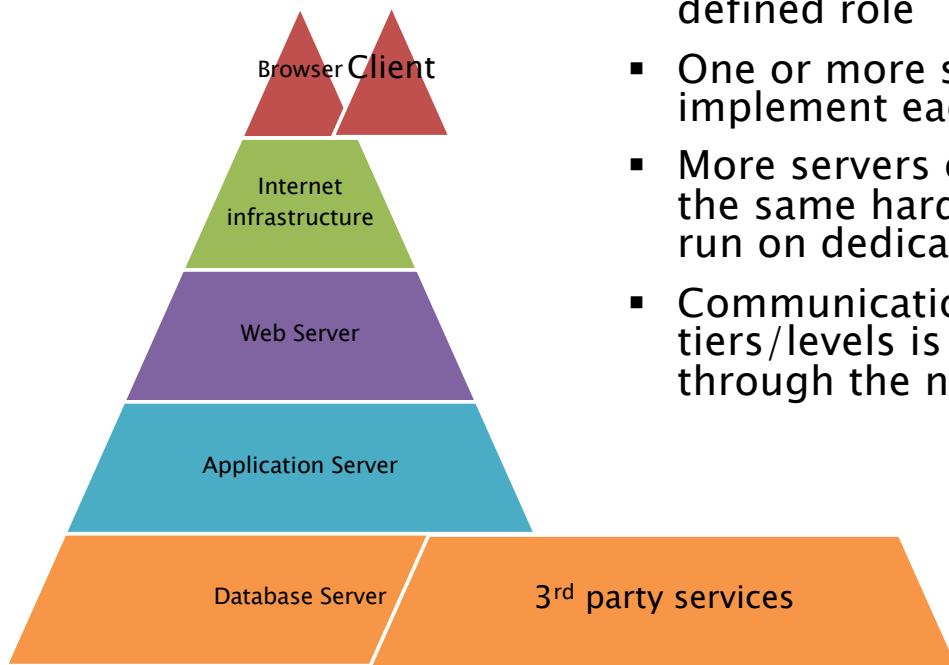

<http://www.evolutionoftheweb.com>

---

4

# N-tier (N-level) architecture

---

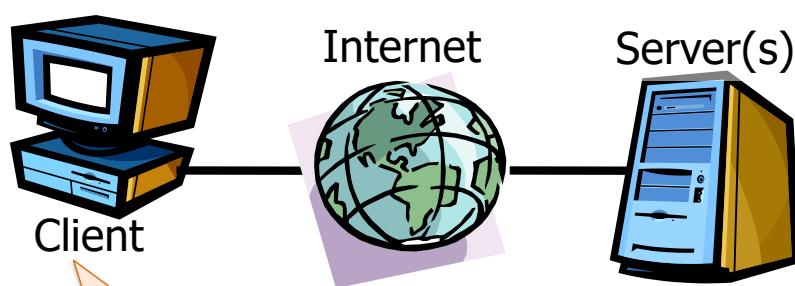

- Each level/tier has a well defined role
- One or more servers implement each tier/layer
- More servers can share the same hardware or can run on dedicated devices
- Communication between tiers/levels is achieved through the network

5

## General base architecture

---

Historically, a web browser.  
Nowadays also:  
Mobile app  
Desktop app  
Other server application

6

# Components

---

- One or more connections to the Internet by means of an Internet Service Provider (ISP).
  - One or more servers implementing each tier/level of the architecture.
  - One or more physical networks for interconnecting the servers.
  - One or more network devices (router, firewall, switch) which implement communication and security policies.
- 

7

# Communication Protocol

---

- Set of rules to transfer information between two (or +) parties
    - ◆ Syntax and format
    - ◆ Semantics
    - ◆ General procedure (steps)
    - ◆ Synchronization mechanisms
    - ◆ Error recovery methods
- 

8

# Network Protocols Stack

---

- HTTP, HTTPS
    - ◆ Transfer of content
  - TCP
    - ◆ Reliable transfer of variable length data
  - IP
    - ◆ Allow transfer of data though a network
  - WiFi, Ethernet, Bluetooth, USB
    - ◆ Local networking (logical access, medium access, physical details)
- 

9

## Definition

---

- “Server” may be defined as:
    - ◆ Logical definition:  
A process that runs on a host that relays information to a client upon the client sending it a request.
    - ◆ Physical definition:  
A host computer on a network that holds information (eg, Web sites) and responds to requests for information
- 

10

# Web server

---

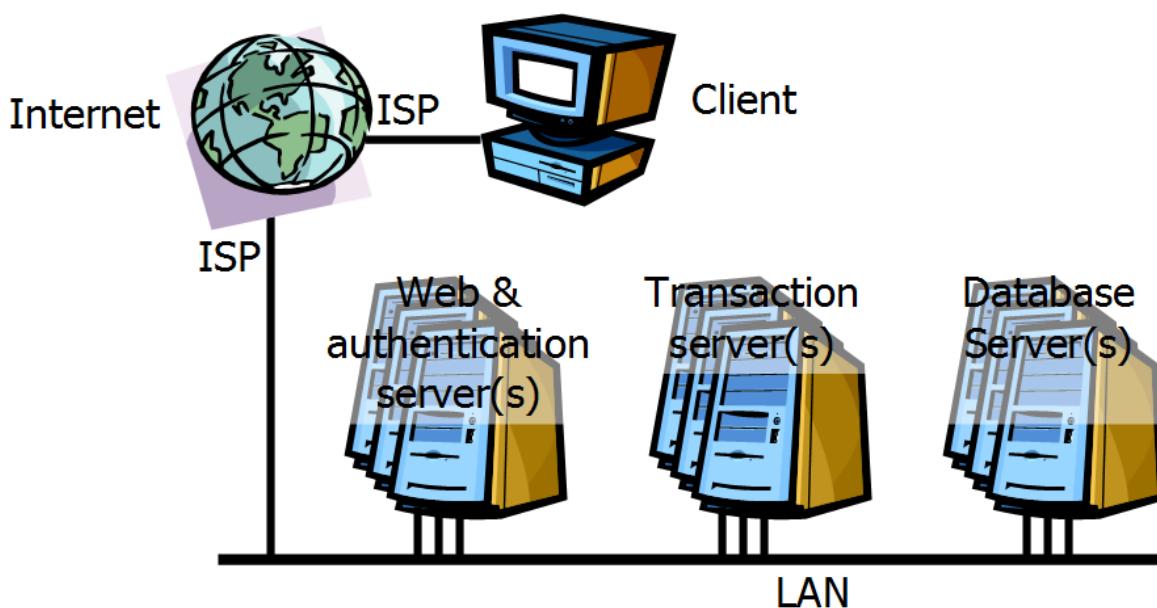

- Manages the HTTP protocol (handles requests and provides responses)
  - ◆ Receives client requests
  - ◆ Reads static pages from the file system
  - ◆ Activates the application server for dynamic pages (server-side)
  - ◆ Provides an HTML file back to the client
- One HTTP connection for each request
- Multi-process, Multi-threaded or Process pool

---

11

## General Architecture

---

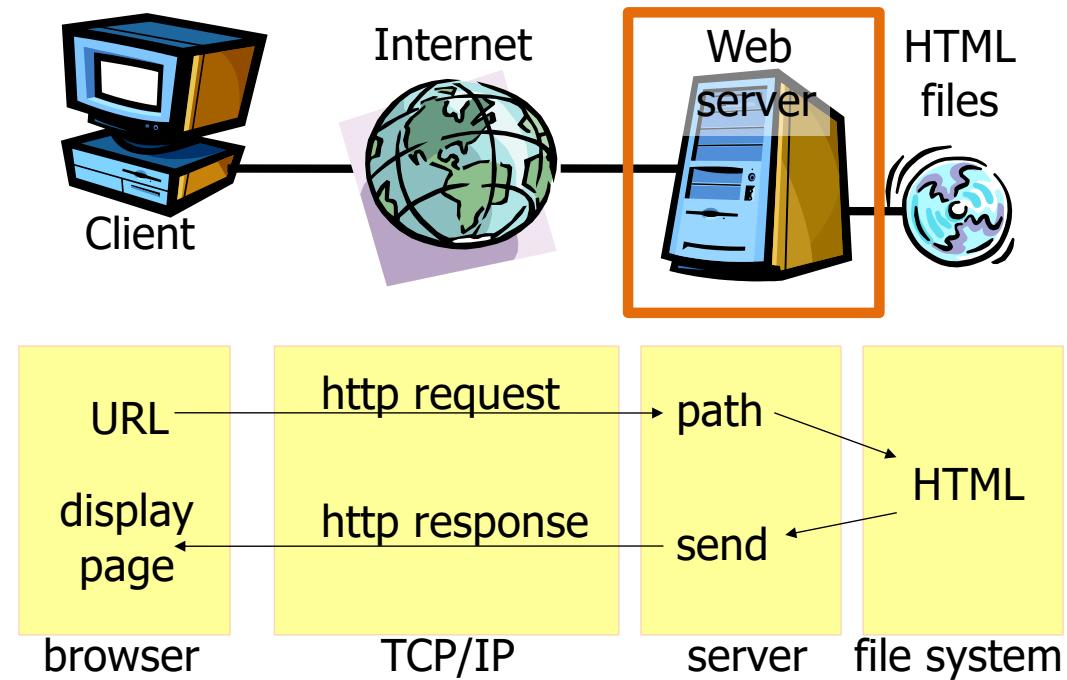

---

12

# Example

---

13

## Adopted standards

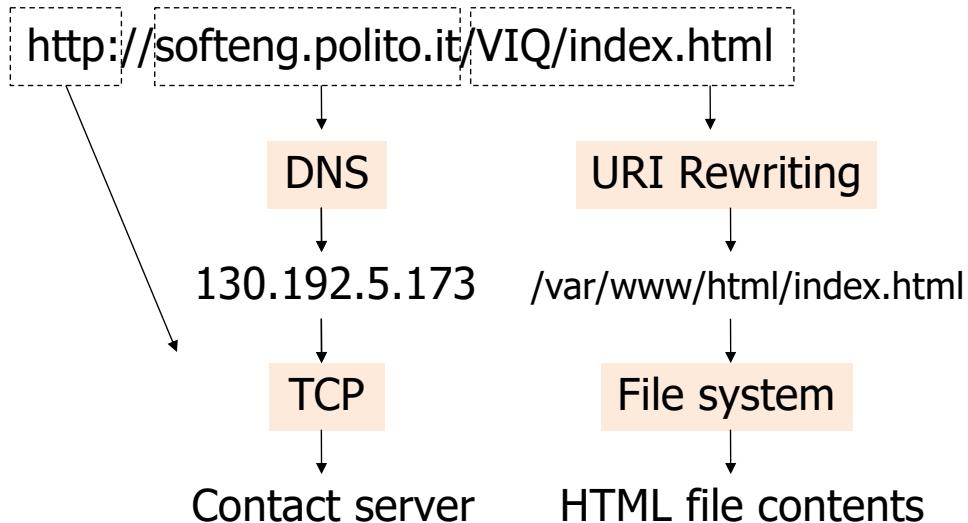

---

- URL (uniform resource locator) for finding web pages
- HTTP (hyper text transfer protocol) for client–server interaction
- HTML (hyper text markup language) for writing web pages

14

# URL

RFC 2396  
http://www.w3.org/Addressing/

15

## URI Basics

- `http://www.sadev.co.za/users/1/contact`
  - `http://www.sadev.co.za?user=1&action=contact`
    - `http://rob:pass@bbd.co.za:8044`
      - `https://bbd.co.za/index.html#about`

16

# HTTP protocol

RFC 2616, RFC 2617  
http://www.w3.org/Protocols

GET /VIQ/index.html HTTP/1.0

Accept: text/html

Accept: image/gif

User-Agent: FireChrome SuperBrowser 9.45

HTTP/1.0 200 OK

Date: Monday, 01-Jan-2001 00:00:00 GMT

Server: Apache 1.3.0

MIME-Version: 1.0

Last-Modified: 31-Dec-2000

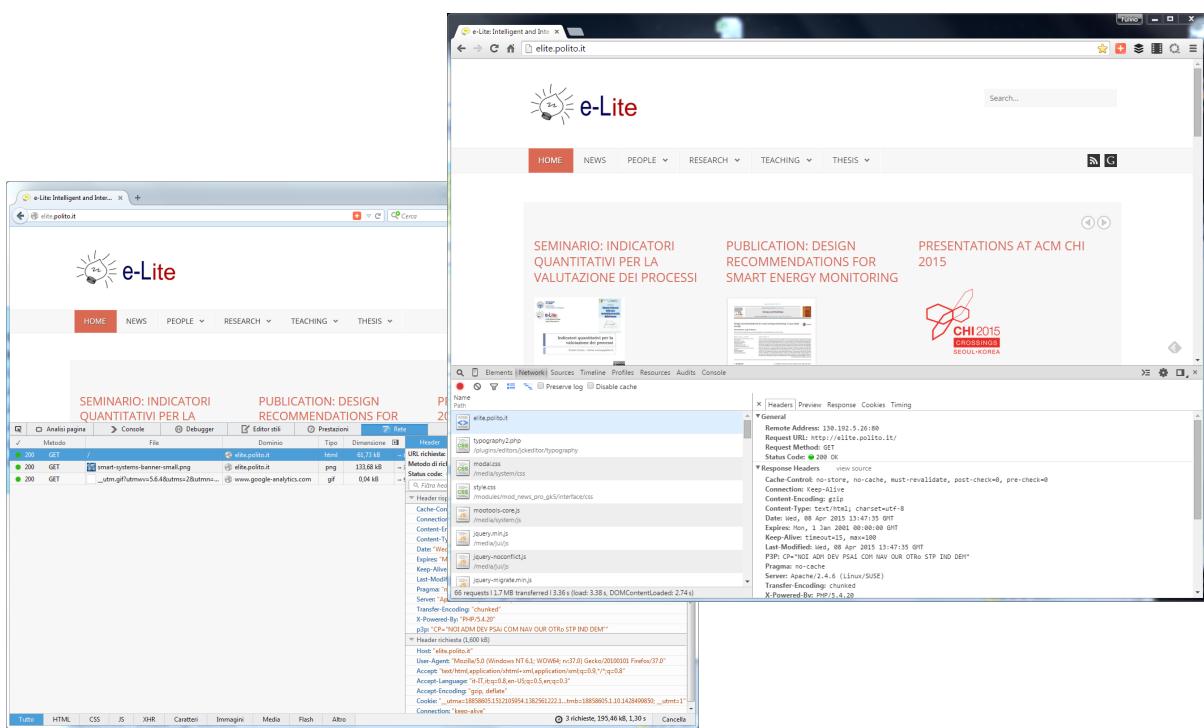

Content-type: text/html

Content-length: 3021

<HTML> . . .

17

## Browser developer tools

18

# Performance measures

---

- Latency: time required for providing a 0 byte http page. Includes the server activation time, the request decoding time, the file access time, the transmission time and the time for closing the connection.
  - ◆ Unit of measure: http/s or s/http
- Throughput: maximum speed at which infinite-sized pages can be sent.
  - ◆ Unit of measure: Bytes (Mbytes)/s
- #Requests / s

---

19

## Delay time

---

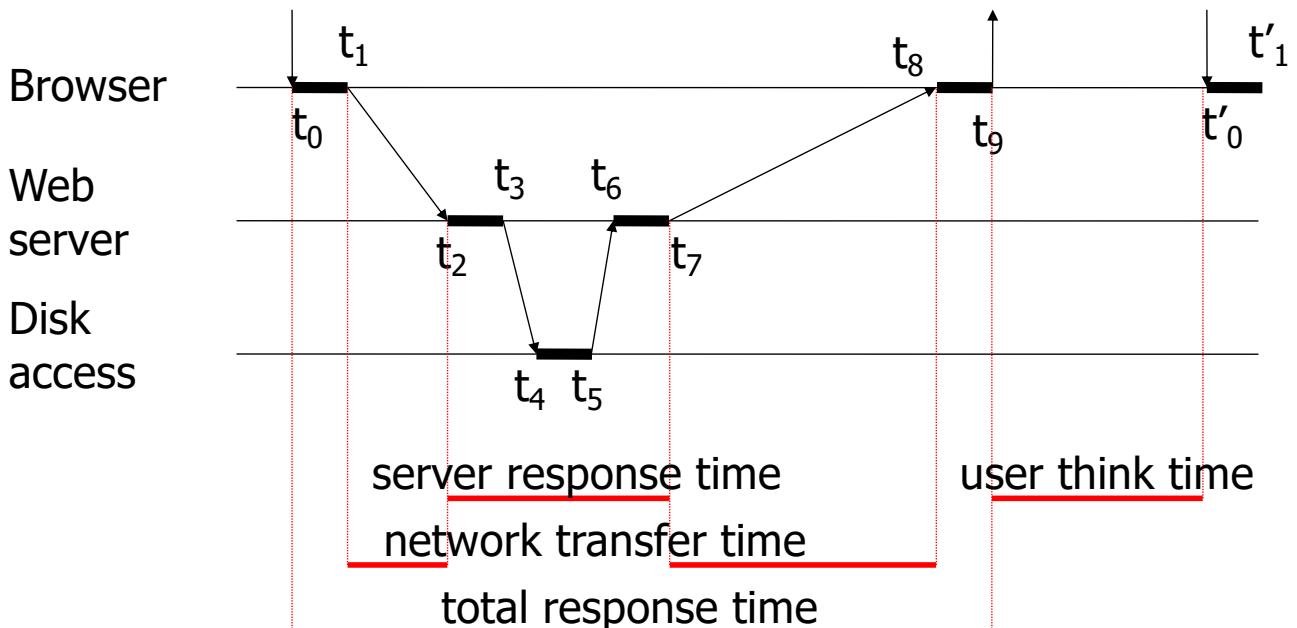

- $T = \text{Latency} + \text{Size}_{\text{HTML}} / \text{Throughput}$
- This equation is valid if:
  - ◆ The other architecture elements (I/O subsystem, network, ...) are not overloaded
  - ◆ The web server has not yet reached its maximum workload
- Example:
  - ◆ Latency: 0,1s
  - ◆ Size<sub>HTML</sub>: 100kBytes
  - ◆ Throughput: 800kBytes/s
  - ◆  $T = 0,1s + 100\text{KBytes} / 800\text{KBytes/s} = 0,225s$

---

20

# Static web transaction

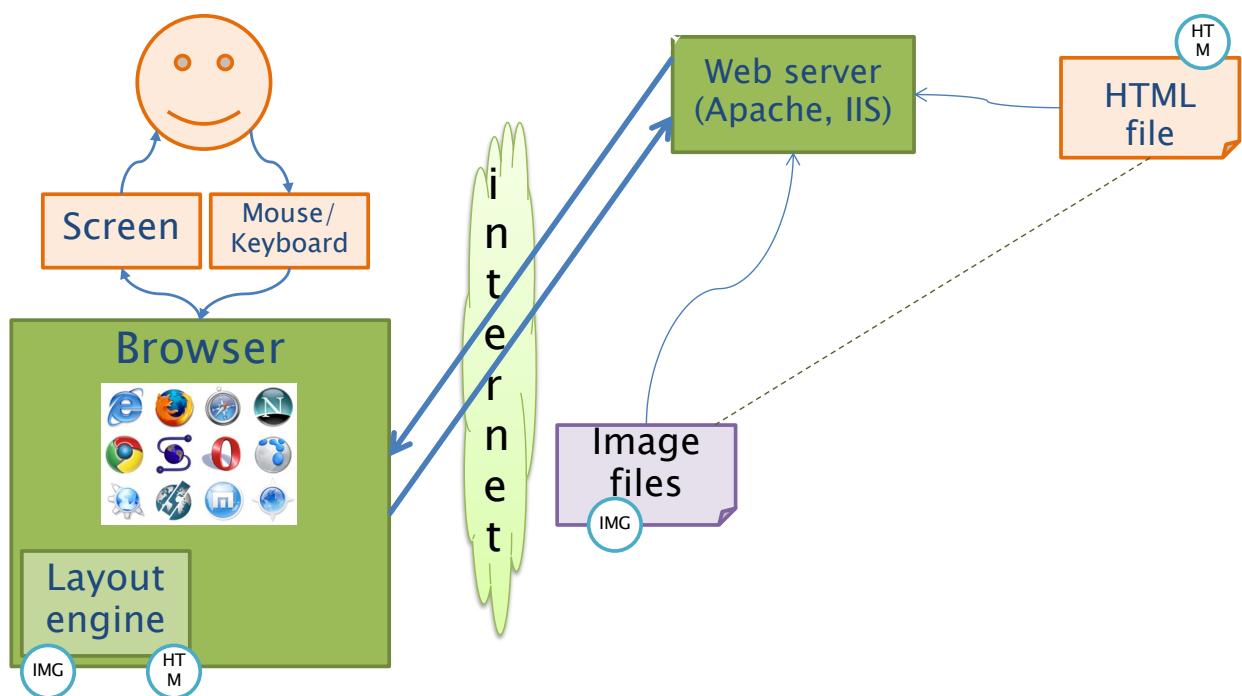

---

21

# General web architecture

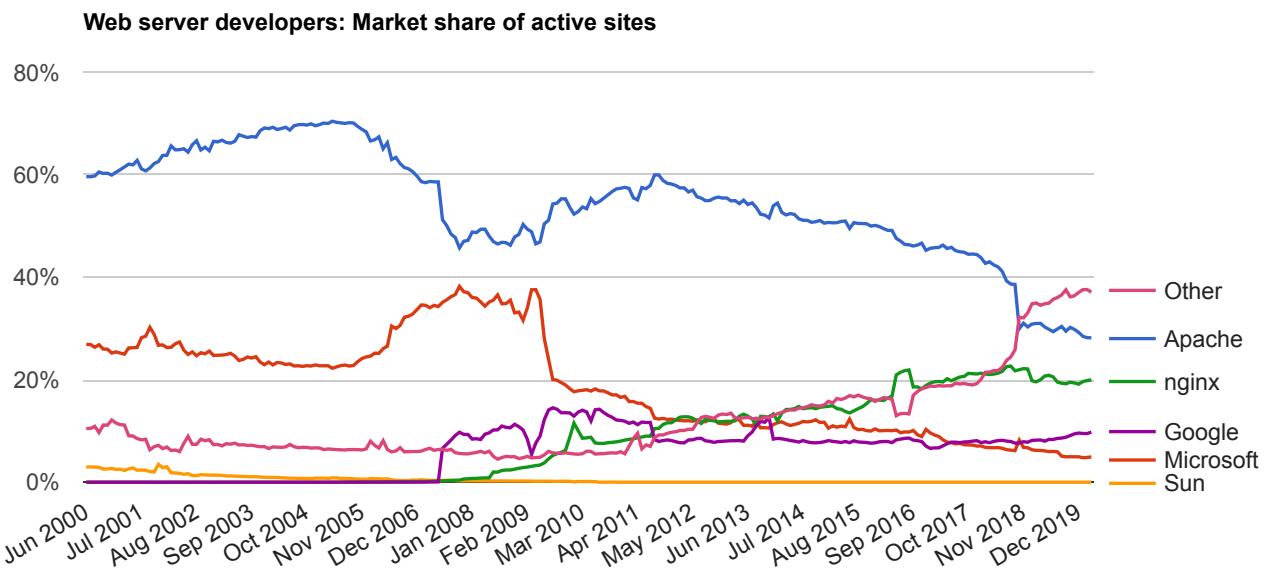

---

22

# Market share of active sites

---

23

# HTML in 5 minutes

---

24

# Application server

---

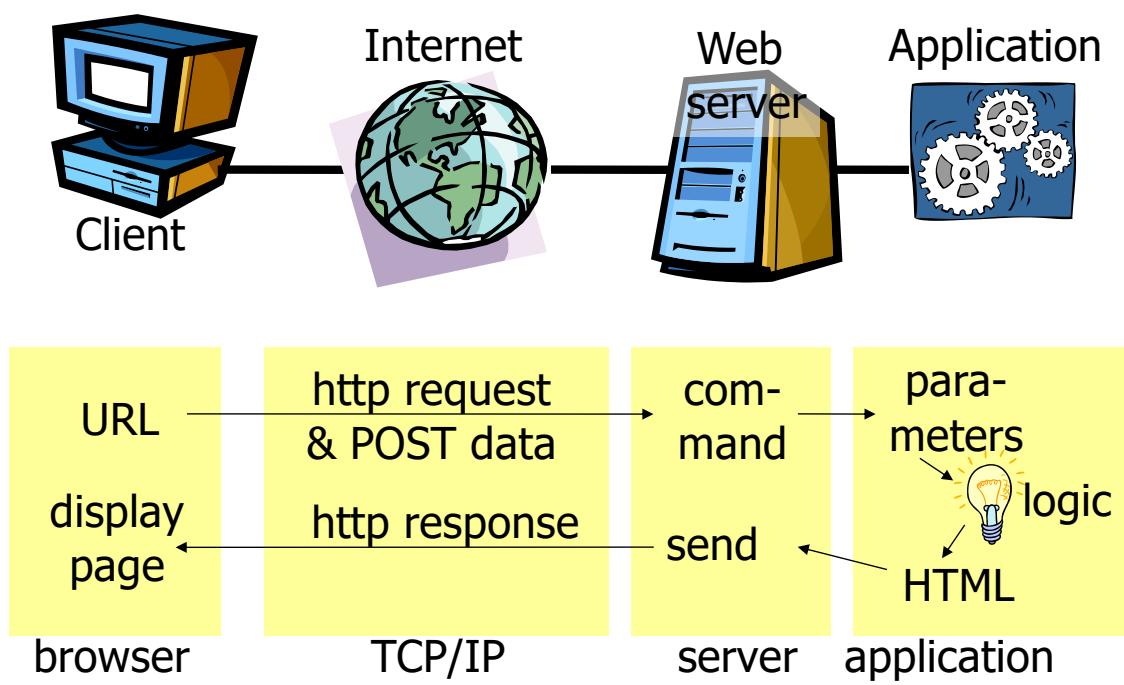

- Dynamic page generation
- Manages the site business logic
- It's the middle tier between the client browser and the data residing on a database
- Implements the session mechanisms
- Different technologies and architectures are available

---

25

## Dynamic web transaction

---

---

26

# Adopted standards

---

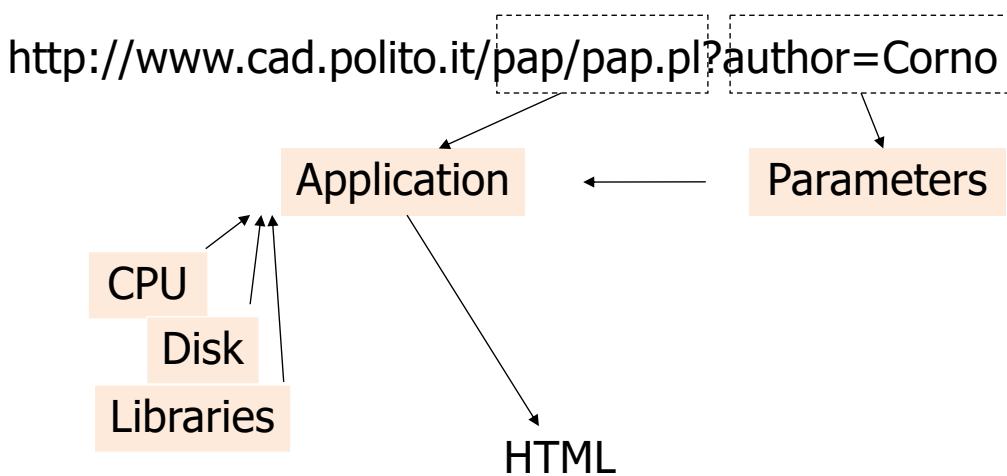

- HTTP-POST for sending user-specified data
- CGI (common gateway interface), ISAPI (internet information server application programming interface), server-side script, java servlet for integrating application logic into web servers
- ASP (active server pages), PHP, PERL as new languages for application development

---

27

## URL (HTTP GET)

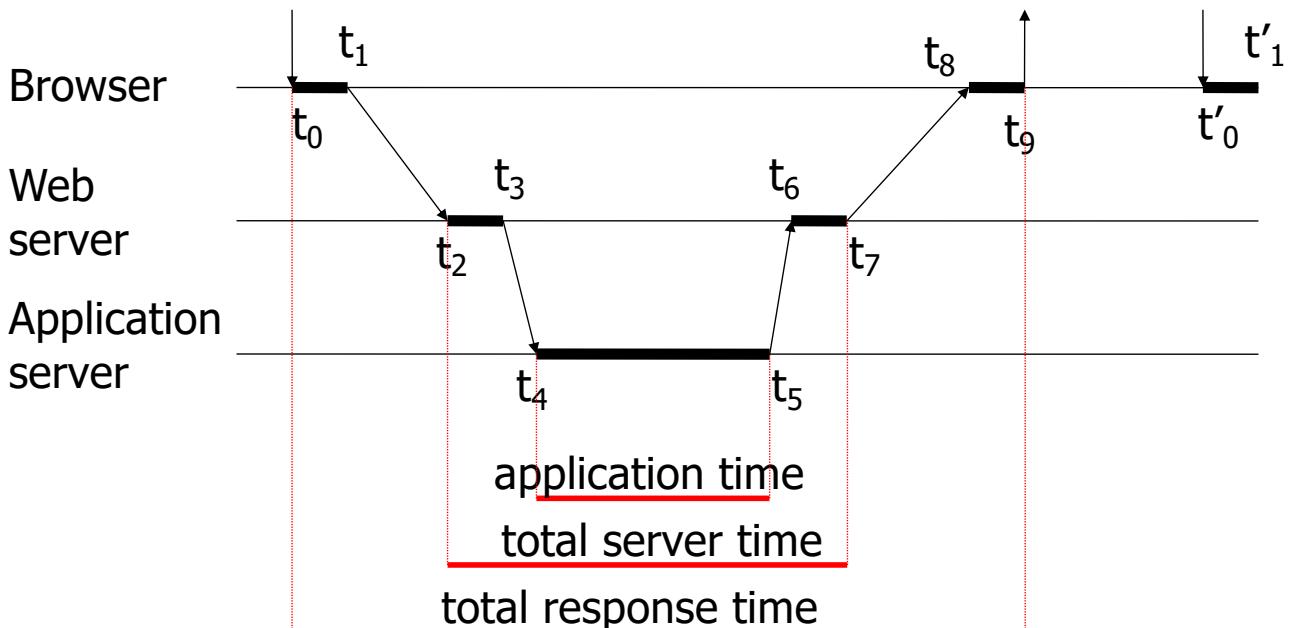

---

---

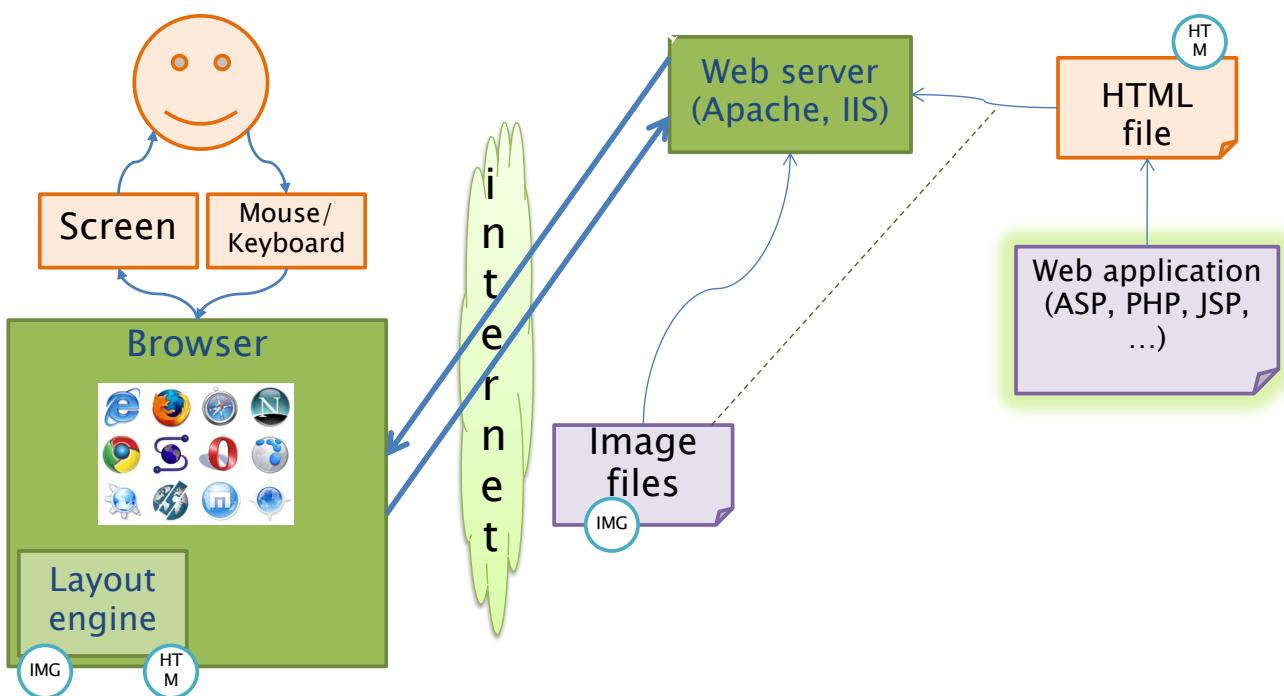

28

# Dynamic web transaction

29

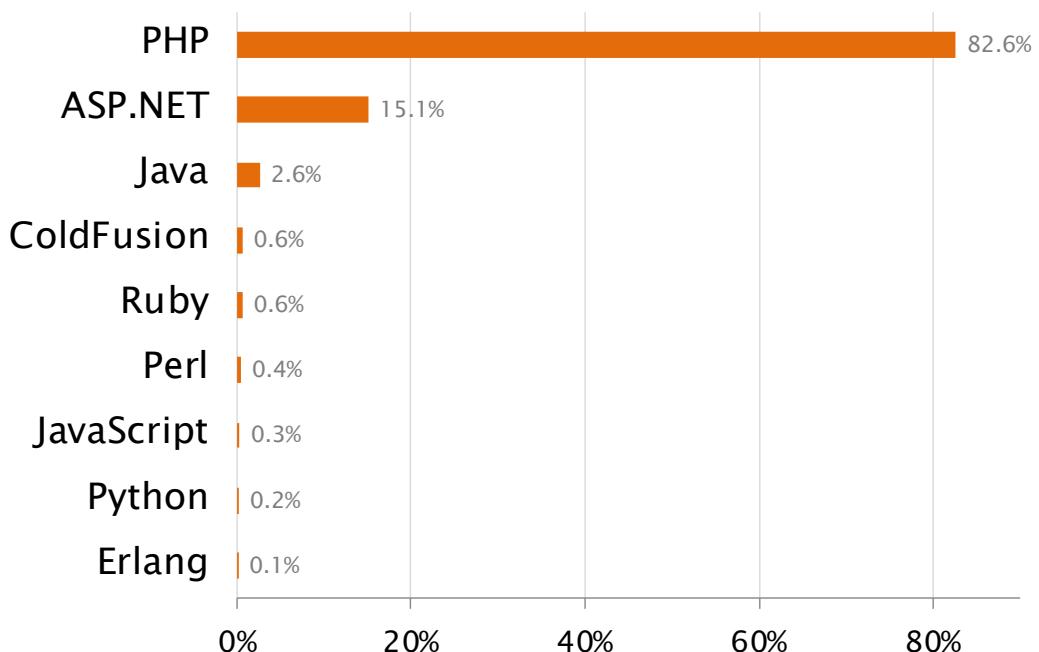

# General web architecture

30

# Application Servers

Percentages of websites using various server-side programming languages

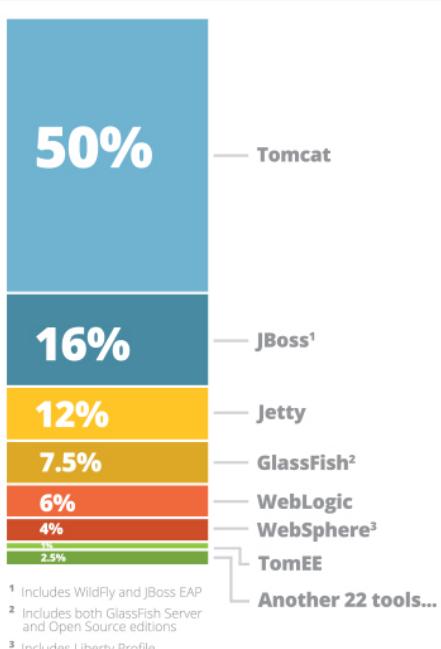

[https://w3techs.com/technologies/overview/programming\\_language/all](https://w3techs.com/technologies/overview/programming_language/all)

31

# Application Servers

**App Server** most often used\*

- Several different technologies
  - PHP
  - .Net
  - Java EE
  - Python
  - Ruby
  - Node.js

<sup>1</sup> Includes WildFly and JBoss EAP

<sup>2</sup> Includes both GlassFish Server and Open Source editions

<sup>3</sup> Includes Liberty Profile

# Database server

---

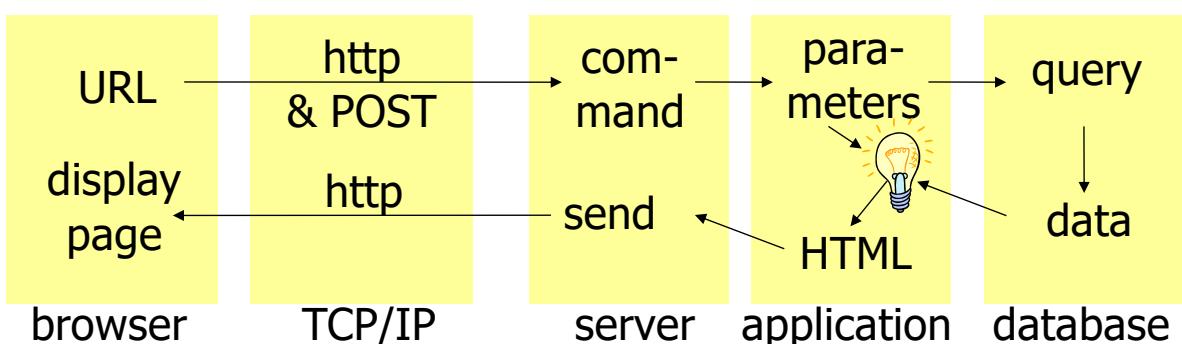

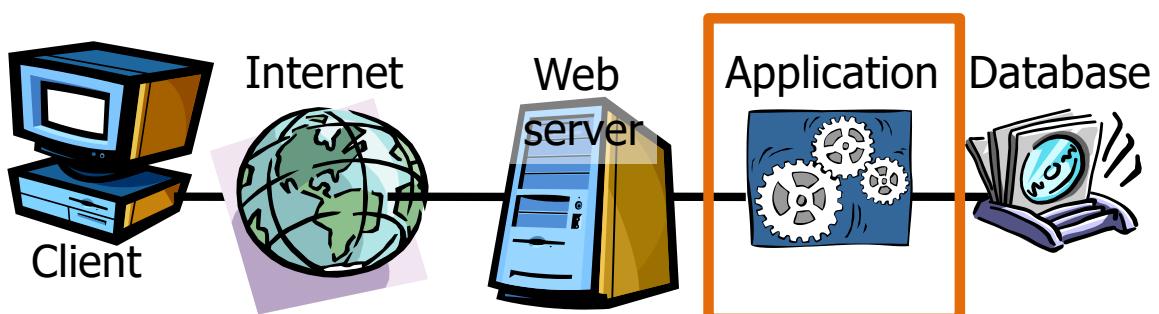

- Stores the data on which the application server works.
- Executes the queries issued by the application server:
  - ◆ Updates stored data
  - ◆ Inserts new data
  - ◆ Provides back query results
- The most frequent/complex queries can be implemented internally as stored procedures

---

33

## Example

---

---

34

# Adopted standards

---

- Cookies for storing the state of a session
- Java, JavaScript, ActiveX, Flash to program the user interface on the browser
- SQL (structured query language), ODBC (open database connectivity) to access data bases

---

35

## Sessions

---

- A session is a set of related HTTP transactions performed by the same user
- They allow a continuous (state-full) interaction with the web application upon a state-less protocol such as HTTP
- They are usually based on cookies

---

36

# Cookies

---

- A cookie is a pair name and value
- Cookies are sent by the web server
  - ◆ Usually upon the first interaction
- The browser keep a list of
  - ◆ Hostname – Cookie ( name + value )
- Every time the browser makes an HTTP request to a host it sends along all the cookies previously sent by that host

---

37

## Session cookies

---

- When the web server receives a request looks for a session cookie
- If none is received, then a new session must be started
  - ◆ A new unique session cookie is generated to identify the session
  - ◆ The cookie is sent back to the browser with the response
- If one is present, it means a session is already in progress
  - ◆ All the operations are linked to the current session

---

38

# Session cookies

---

- When the user is identified (e.g. through a login) then the session is linked to the user
  - ◆ All following operations will be relative to the user linked to the session
- Cookie have an expiration time
  - ◆ After expiration they are not sent back to the server anymore
  - ◆ Thus sessions have a time limit

---

39

# Database server

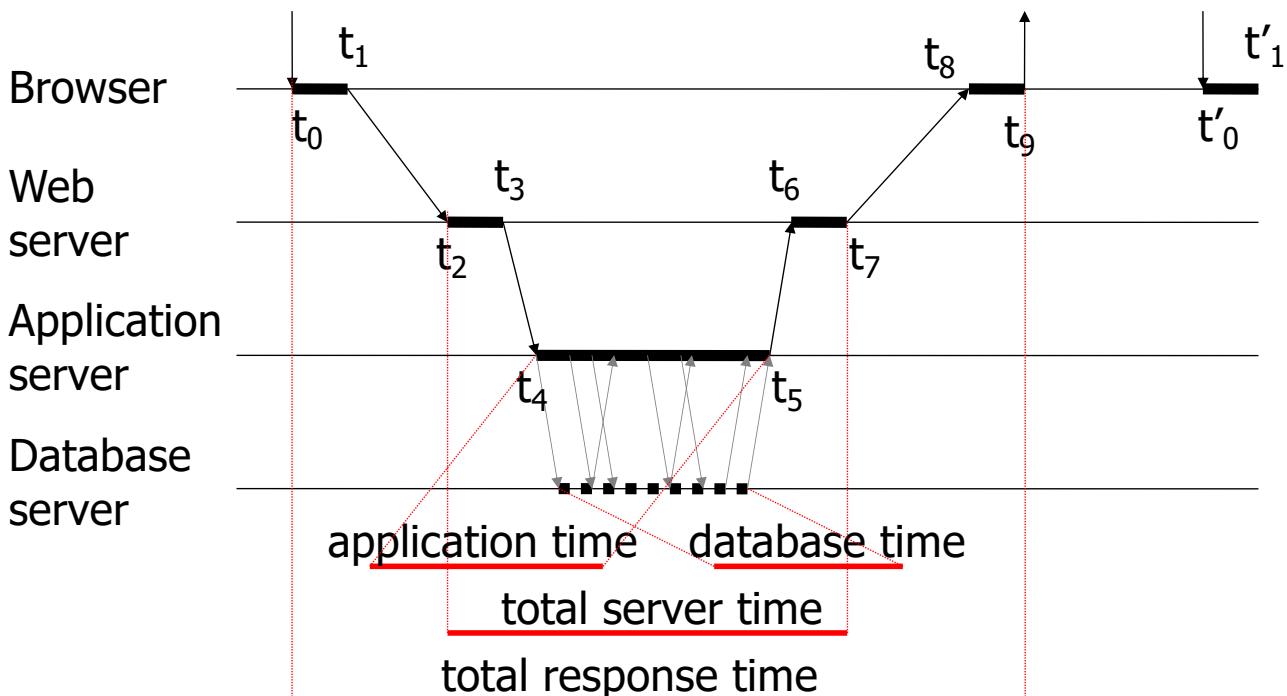

---

- Queries are almost always in SQL
  - ◆ `SELECT * FROM table;`
  - ◆ ....
- Often adopts the relational database model
  - ◆ Other models can be used
    - Object model
    - Triple model
- The most advanced/complete solutions are called Transaction servers

---

40

# Database-driven transaction

41

## Example (PHP)

The application composes the query

```
<?php  
$query = "SELECT doc_id FROM key_doc_index, keywords WHERE  
key_doc_index.key_id = keywords.id AND keywords.key =  
$_REQUEST["query"]";
```

The query is sent to the db-server and a rowset containing the results is returned

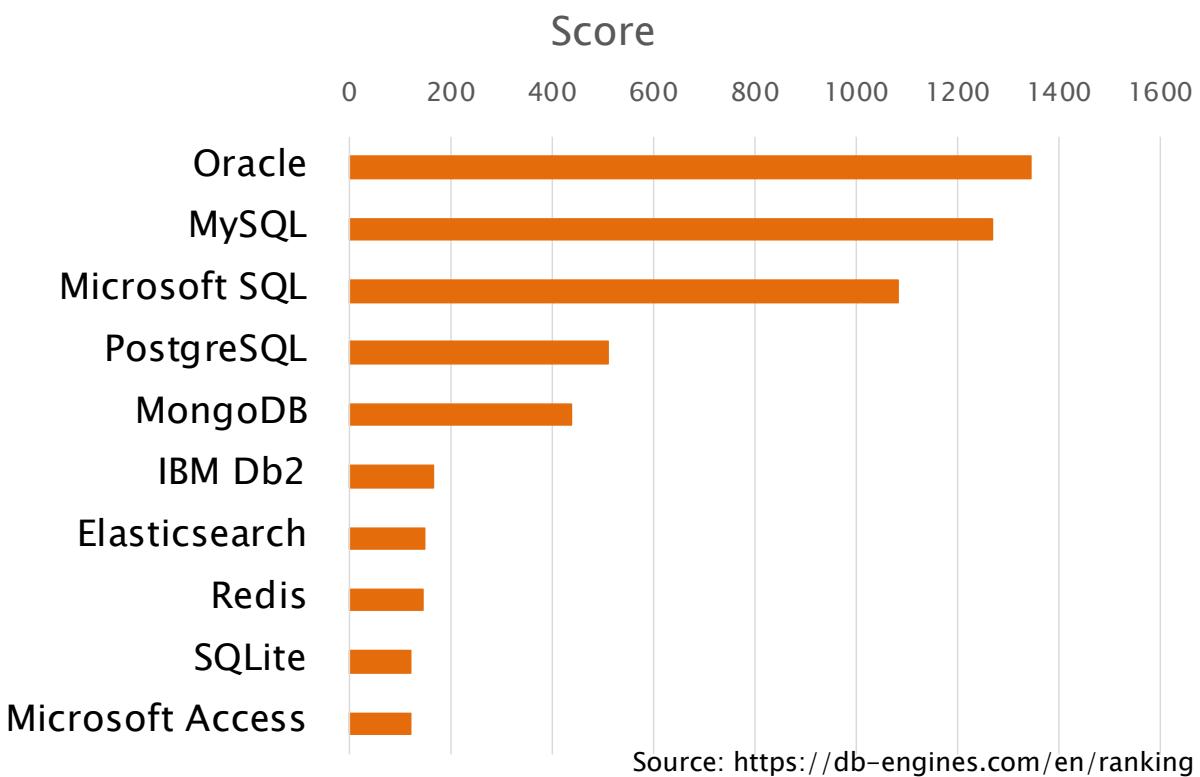

```
$rowset = mysql_query($query);
```

```
while($row = mysql_fetch_row($rowset))  
{  
//elaborate data  
}  
?>
```

The application processes the data

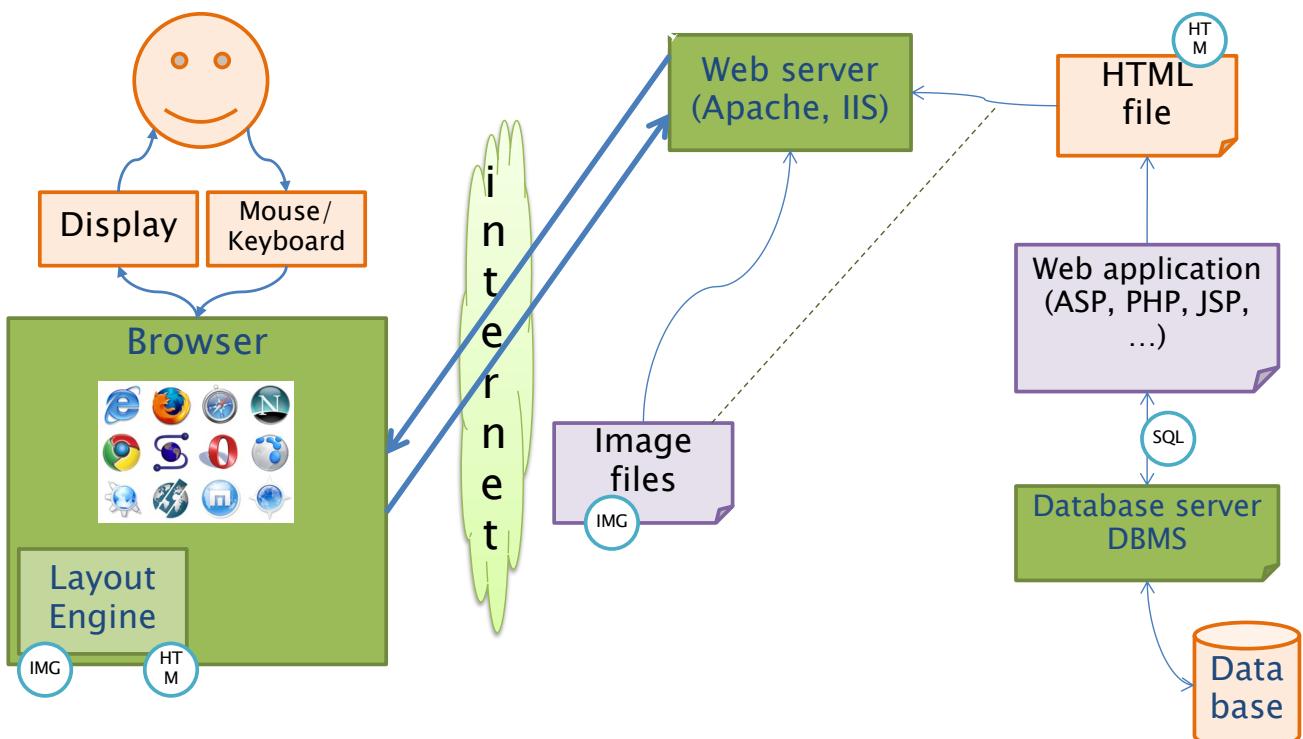

42

# DB Server diffusion

43

# General web architecture

44

# Client-side programming

---

- Making a web page **dynamic**
  - ◆ Able to change the page content after it was loaded by the server
  - ◆ Able to interact with the user, on the browser
  - ◆ Able to “augment” the default interactions offered by the browser
- Examples:
  - ◆ Animations on the page
    - e.g. menus, accordions, slideshows, hide/show, ...
  - ◆ Form validation

---

45

# Client-side programming

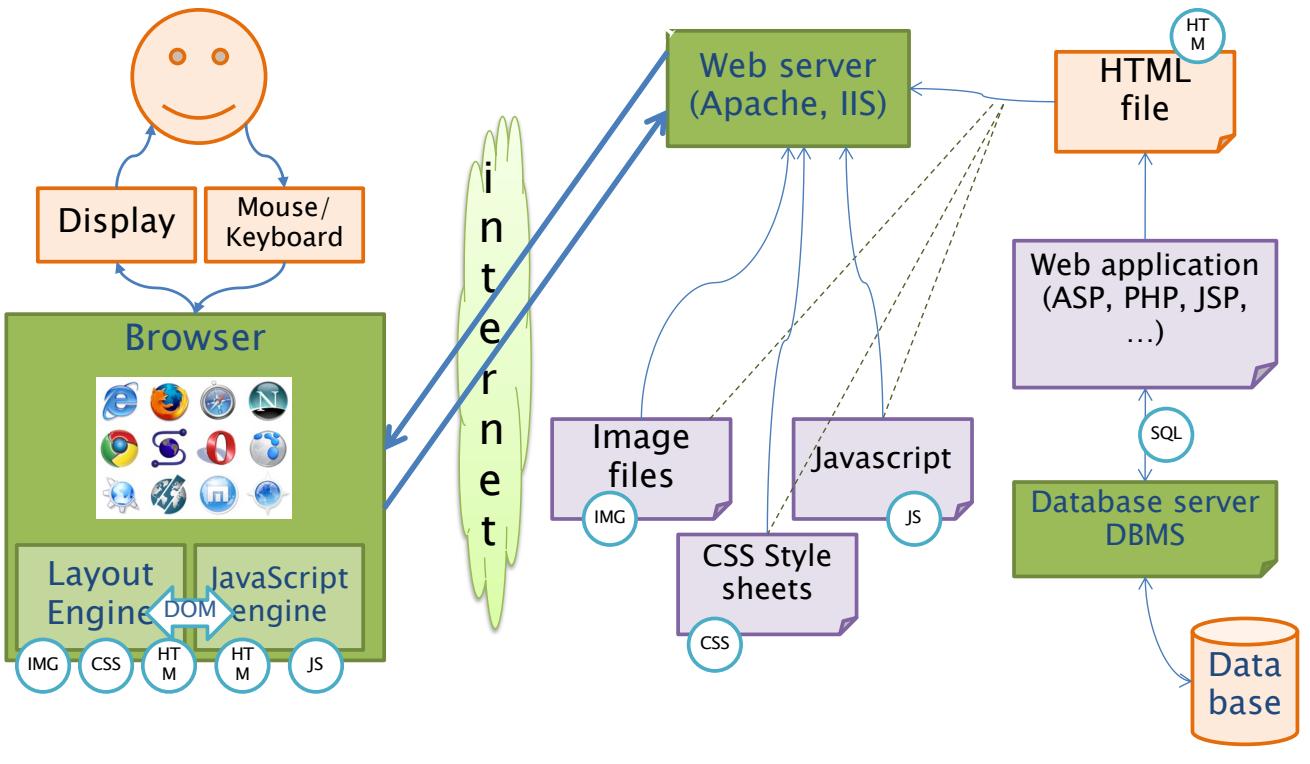

---

- Requires:
  - ◆ A programming language accepted by all browsers
  - ◆ A program embedded in the web page
  - ◆ An execution engine in the browser
- Limitations:
  - ◆ All data needed by the program must be known beforehand (when the page is loaded)
  - ◆ The program must have a restricted access to the execution environment

---

46

# General web architecture

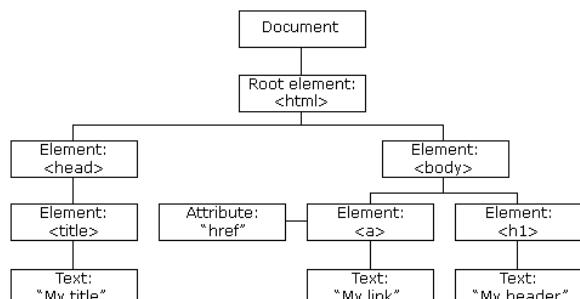

47

## Document Object Model (DOM)

- Standard data structure for representing the web page content
- Supported by all browsers
- Javascript programs can read & modify the DOM
- Abstracts
  - ◆ Browser
  - ◆ HTML
- The HTML DOM is a standard for how to get, change, add, or delete HTML elements

*"The W3C Document Object Model (DOM) is a platform and language-neutral interface that allows programs and scripts to dynamically access and update the content, structure, and style of a document."*

48

# Separating layout from content

---

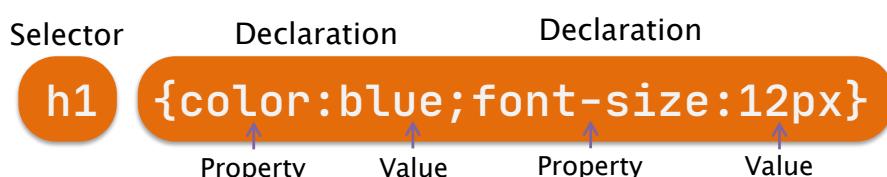

- Goals:
    - ◆ Allow the definition of complex layouts
    - ◆ Adapt web pages to different resolutions
    - ◆ Adapt web pages to different devices (e.g., mobile)
    - ◆ Adapt web pages to different preferences (e.g., color schemes)
    - ◆ Adapt web pages to different media (e.g., text vs video)
    - ◆ In a standard way
  - ‘Adapt’ means:
    - ◆ Resize, Reflow, Show/Hide, Substitute, Animate, Highlight, Move, ...
  - Solution: Cascading Style Sheets (CSS)
- 

49

## CSS

---

- “Declarations” applied to some “Selector”
  - ◆ **Selectors** identify portions of the ~~web page~~ DOM
  - ◆ **Declarations** set the value of some “properties”
  - ◆ **Properties** control aspect, position, layout, behavior

50

# Client-side, server-side, databases

---

Programming languages used in most popular websites*				
Websites	Popularity (unique visitors per month) <sup>[1]</sup>	Front-end (Client-side)	Back-end (Server-side)	Database
Google.com <sup>[2]</sup>	1,600,000,000	JavaScript	C, C++, Go, <sup>[3]</sup> Java, Python	BigTable, <sup>[4]</sup> MariaDB <sup>[5]</sup>
Facebook.com	1,100,000,000	JavaScript	Hack, PHP (HHVM), Python, C++, Java, Erlang, D, <sup>[6]</sup> Xhp, <sup>[7]</sup> Haskell <sup>[8]</sup>	MariaDB, MySQL, <sup>[9]</sup> HBase Cassandra <sup>[10]</sup>
YouTube.com	1,100,000,000	JavaScript	C, C++, Python, Java, <sup>[11]</sup> Go <sup>[12]</sup>	BigTable, MariaDB <sup>[5]</sup> <sup>[13]</sup>
Yahoo	750,000,000	JavaScript	PHP	MySQL, PostgreSQL <sup>[14]</sup>
Amazon.com	500,000,000	JavaScript	Java, C++, Perl <sup>[16]</sup>	Oracle Database <sup>[17]</sup>
Wikipedia.org	475,000,000	JavaScript	PHP, Hack	MySQL <sup>[citation needed]</sup> , MariaDB <sup>[18]</sup>
Twitter.com	290,000,000	JavaScript	C++, Java, Scala, Ruby on Rails <sup>[19]</sup>	MySQL <sup>[20]</sup>
Bing	285,000,000	JavaScript	ASP.NET	Microsoft SQL Server
eBay.com	285,000,000	JavaScript	Java, <sup>[21]</sup> JavaScript <sup>[22]</sup>	Oracle Database
MSN.com	280,000,000	JavaScript	ASP.NET	Microsoft SQL Server
Microsoft	270,000,000	JavaScript	ASP.NET	Microsoft SQL Server
Linkedin.com	260,000,000	JavaScript	Java, JavaScript, <sup>[23]</sup> Scala	Voldemort <sup>[24]</sup>
Pinterest	250,000,000	JavaScript	Django (a Python framework), <sup>[25]</sup> Erlang	MySQL, Redis <sup>[26]</sup>
WordPress.com	240,000,000	JavaScript	PHP, JavaScript <sup>[27]</sup> (Node.js)	MariaDB, MySQL

---

51

## Web 2.0

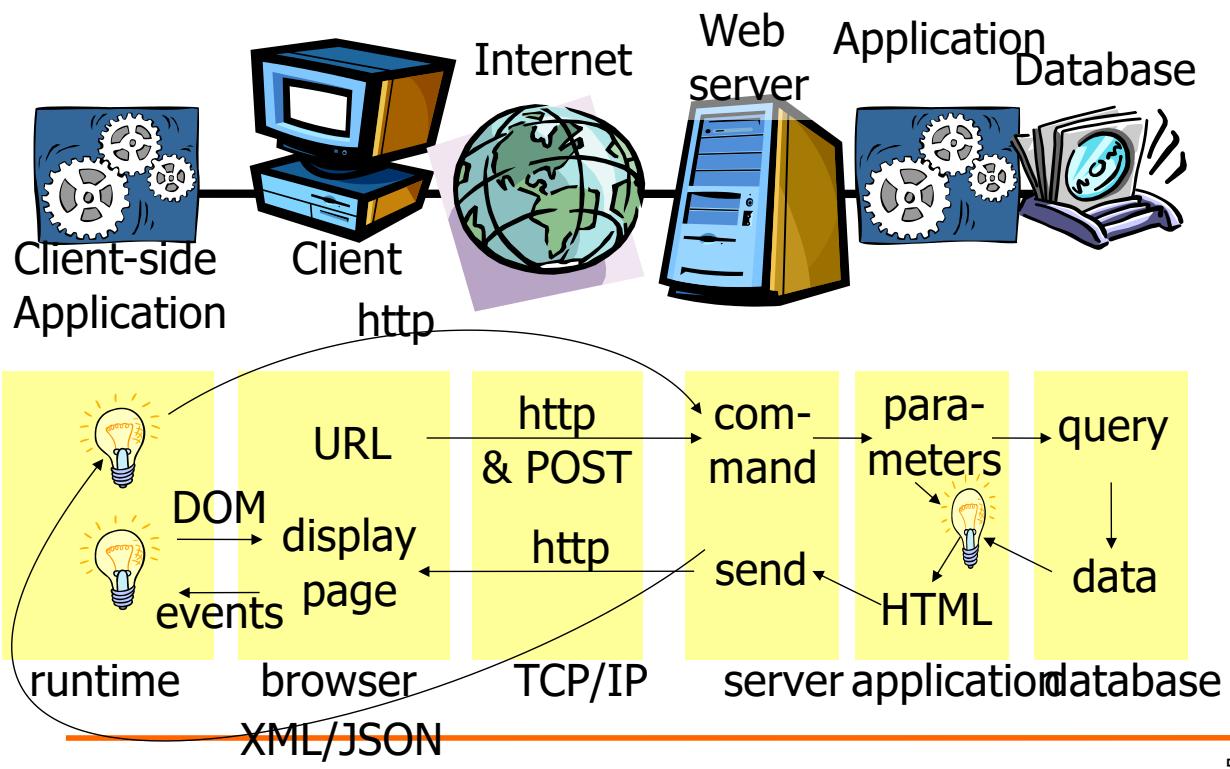

---

- Web applications support social interaction models
- Peer exchange and user-contributed content instead of rigid publisher/reader pattern
  - ◆ Online communities
- Rich, dynamic, interactive user interfaces
- Integration of contents across web sites (mashups)

---

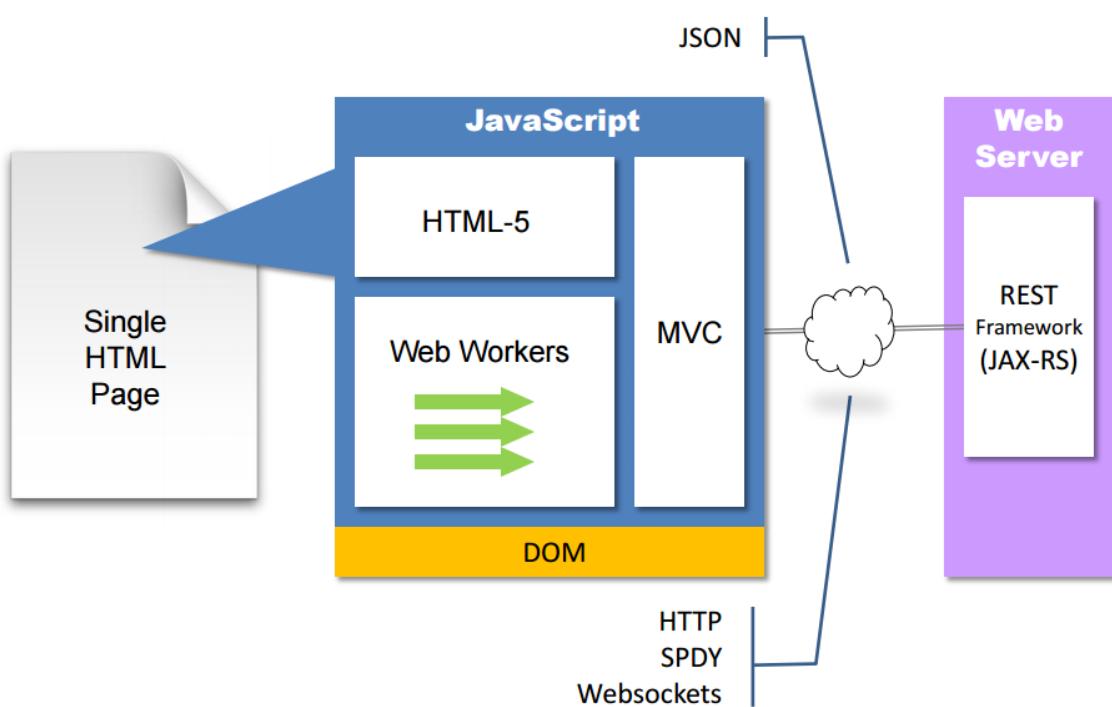

52

# Rich-Client Asynchronous Transactions

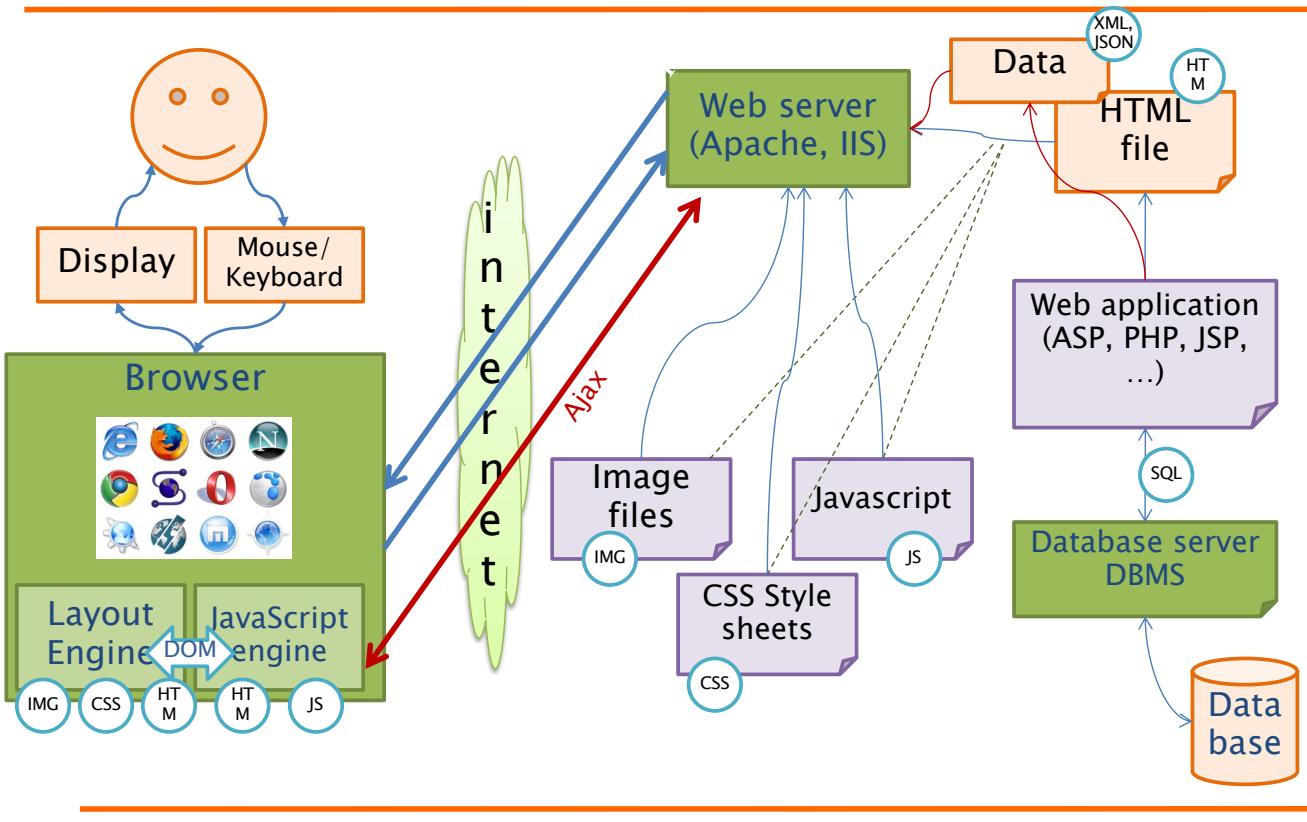

53

# Single Page Applications (SPA)

54

# General web architecture

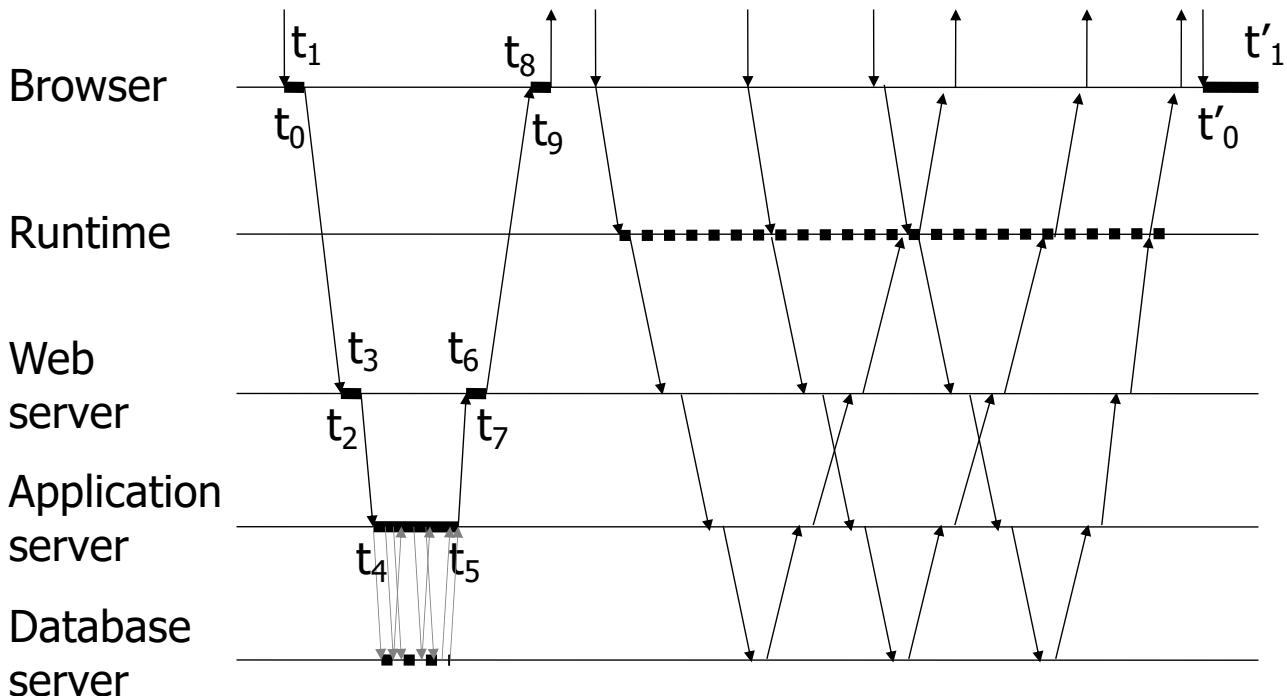

55

## Adopted standards

- Dynamic HTML: DOM, Javascript, CSS
  - ◆ JavaScript, Flash to handle a runtime environment on the browser
  - ◆ DOM (XHTML Document Object Model) to allow on-the fly modification of the web page
  - ◆ CSS 2.1 to modify attribute and handle objects
- AJAX: Asynchronous Javascript and XML
  - ◆ XMLHttpRequest for asynchronous communication to the server
  - ◆ Data transfer formats: JSON, XML, RDF, RSS, Atom, FOAF, ...
- Mash-up technology

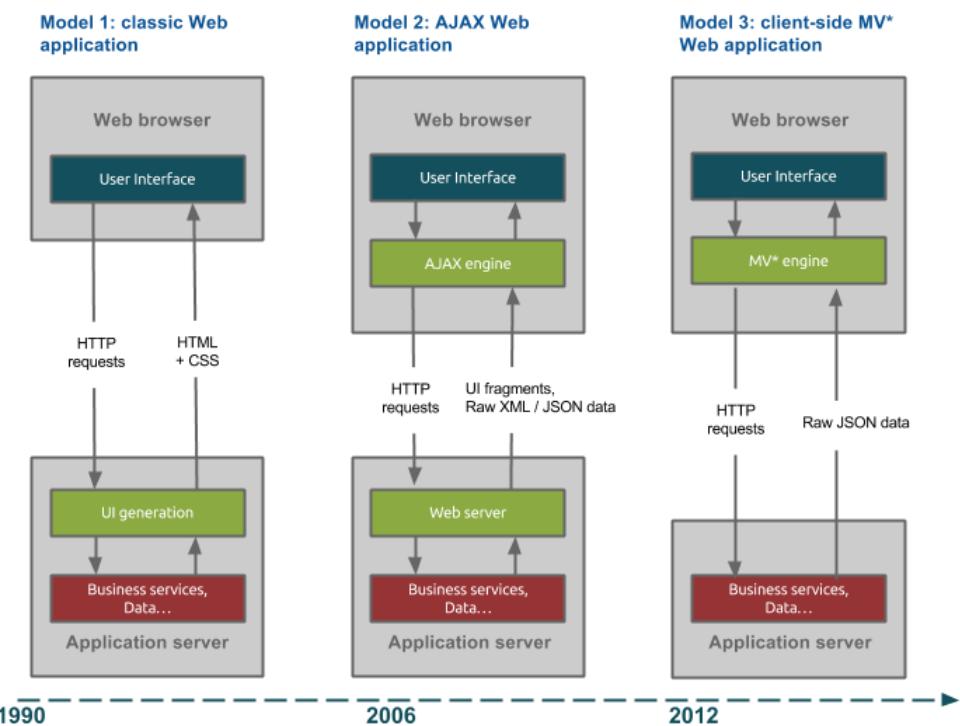

56

# Rich-client transaction

57

# Web application architectures

<http://blog.octo.com/en/new-web-application-architectures-and-impacts-for-enterprises-1/>

58

# The real word is different...

---

- The users
- Functionality
- Flexibility
- Portability
- Reliability
- Security
- Integrity
- Maintenance
- Performance
- Scalability
- Costs
- Maintainance
- Development times
- Interactions with existing systems
- Interactions with the “physical” world

59
